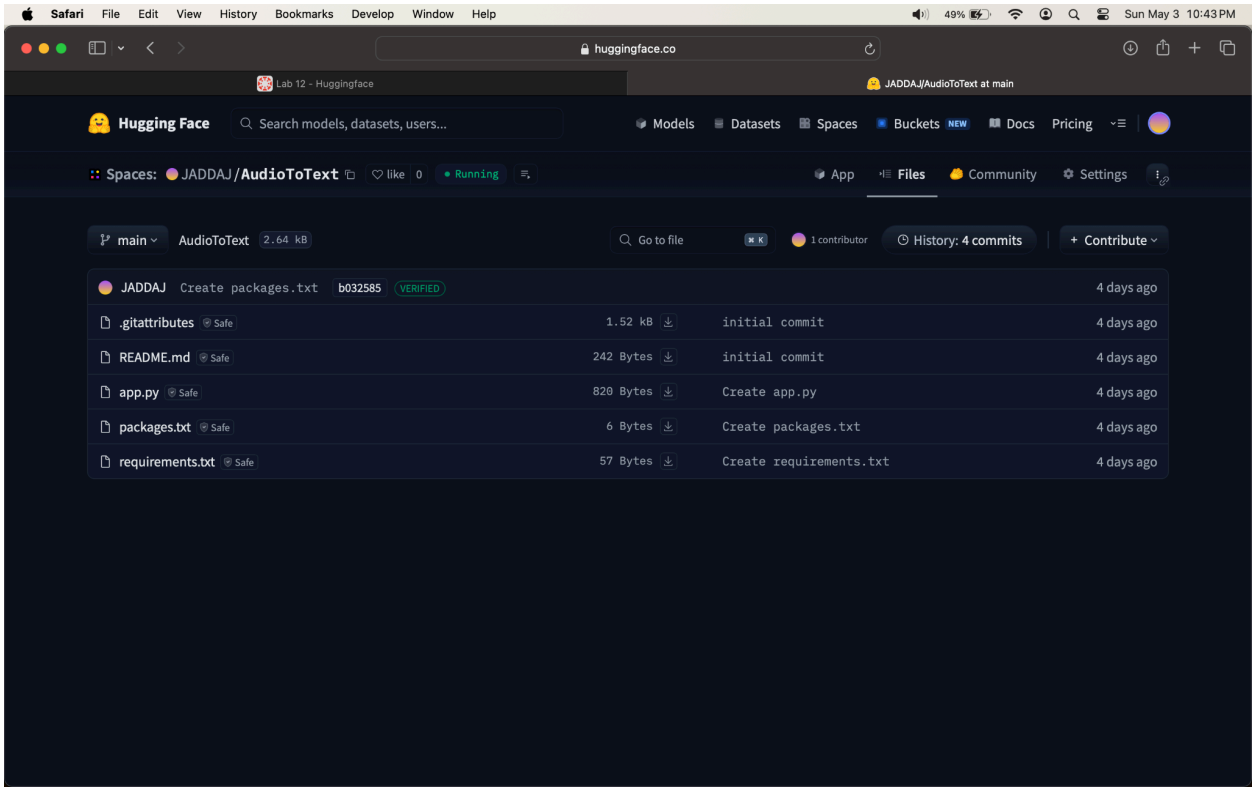
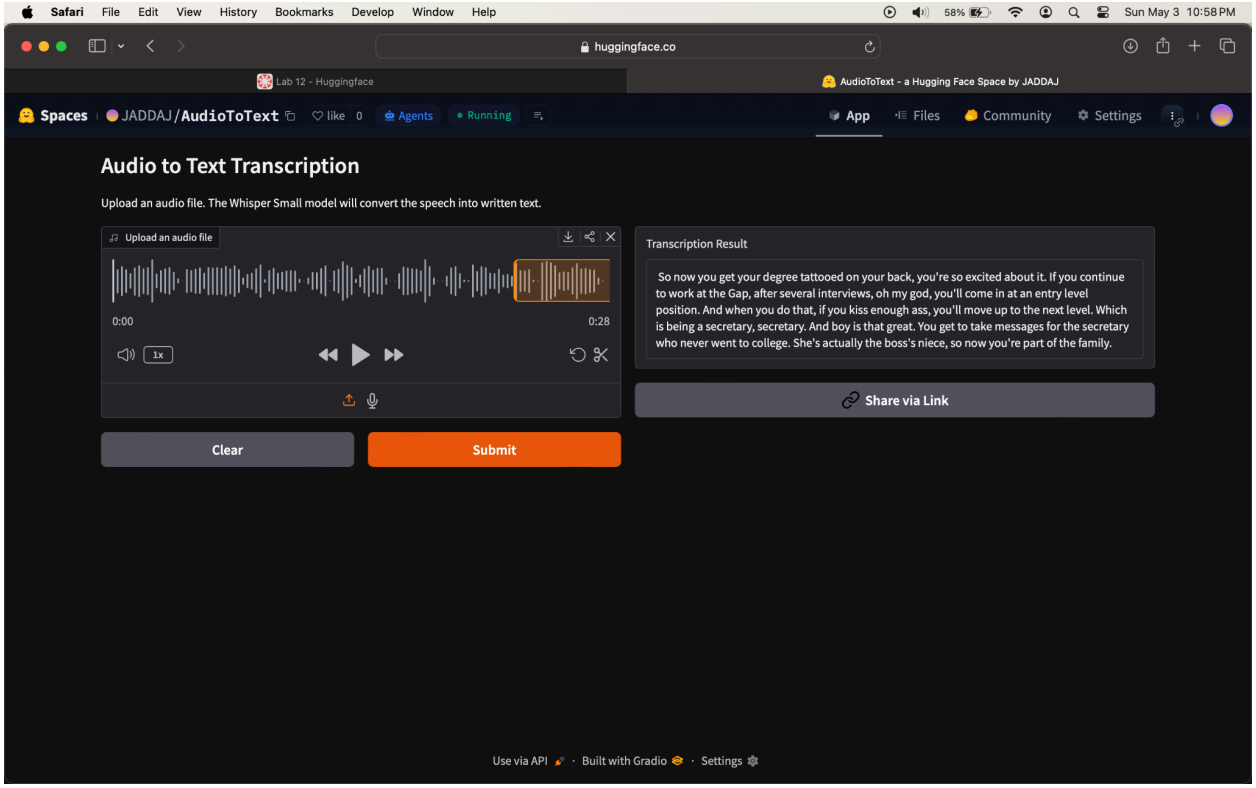
Lab 12: HuggingFace
Jorge Angon, Alexis Velasquez
Audio to text HuggingFace

Model Chosen: openai/whisper-small

Purpose:
This model converts spoken audio into written text. It is used for automatic speech recognition. I chose this model because our lab topic was audio-to-text, and Whisper Small is made for transcribing speech from audio files.

Installation and implementation
The project was implemented using Hugging Face Spaces with Gradio. Instead of installing everything locally on my computer, the required libraries were installed in the online Space using requirements.txt. The packages.txt file was used to include FFmpeg, which helps read audio files. The app.py file connects the website upload button to the Whisper Small model.





Output explanation

For the output, I uploaded a short audio file into the web app which has to be under 30 seconds. Then the app sent the uploaded file to the Whisper Small model. After processing the audio, the model returned the spoken words as written text. The transcription result appeared directly on the webpage. This shows that the model was successfully implemented because the input was an audio file and the output was readable text.
